

# Time Dependent Recoil In Vacuum measurements on radioactive ions

*Georgi Georgiev*  
*CSNSM, Orsay, France and*  
*ANU, Canberra, Australia*

XXI<sup>st</sup> Colloque  
**GANIL**

**2019**  
September 9<sup>th</sup> – 13<sup>th</sup>  
Strasbourg

# Nuclear moments – Why?

- Nuclei with non-zero spin have magnetic dipole moment
 
$$\mu = gI [\mu_N]$$

- Sources of nuclear magnetism:

- orbital movement of charged particles;
- intrinsic spin of the nucleons.

- Magnetic moment of a nucleus:

$$\vec{\mu} = \sum_{k=1}^A g_\ell^{(k)} \vec{\ell}^{(k)} + \sum_{k=1}^A g_s^{(k)} \vec{s}^{(k)} - \text{the contribution of every nucleon}$$

- $\pi/\nu$   $g$  factors:

$\begin{array}{ll} \textit{free - nucleon} \\ g_s^\pi = 5.585 & g_\ell^\pi = 1 \\ g_s^\nu = -3.286 & g_\ell^\nu = 0 \end{array}$		$\begin{array}{ll} \textit{effective} \\ g_s^\pi = 0.7 * g_s^\pi & g_\ell^\pi = 1.x \\ g_s^\nu = 0.7 * g_s^\nu & g_\ell^\nu = 0.y \end{array}$

- Ground-state's moments of the Mg isotopes:

→ s.p. states, not sensitive to configuration mixing but to the odd-nucleon orbit  
 e.g. <sup>31</sup>Mg – magnetic moment of 1/2<sup>+</sup> state well reproduced even if its energy (*sd* model space) is > 1 MeV off

# Even-even Mg isotopes ( $2^+$ states)

- $^{26}\text{Mg}$  – new results from a TF measurement (B.P. McCormick *et al.*, PLB 779, 445 (2018))
  - $^{24}\text{Mg}$  (N=Z) and  $^{26}\text{Mg}$  ( $vd_{5/2}$  subshell) – rather “simple” theory cases
  - $^{28}\text{Mg}$  –  $^{32}\text{Mg}$  – real tests for the interactions
- $^{28}\text{Mg}$  – the important (or not?) role of the N=16 sub-shell gap at Z=12?
  - New estimations for the borders of the “Island of Inversion”  
T. Otsuka *et al.*, INPC 2016 presentation.  
→ it is necessary to include *pf admixtures* in order to reproduce the structure of the excited states already in  $^{30}\text{Mg}$

# Experimental approach

- Important ingredients:
  - Obtain **nuclear spin-oriented** ensemble
  - Apply an external (magnetic) perturbation  $\rightarrow \omega_L = - \frac{g\mu_N B}{\hbar}$ 
    - Have sufficient time for the interaction
    - Know with a sufficient precision the perturbing field
  - Measure the level of perturbation

- **Time Differential measurements:** *E. Recknagel in Pure and Applied Physics, 40C*

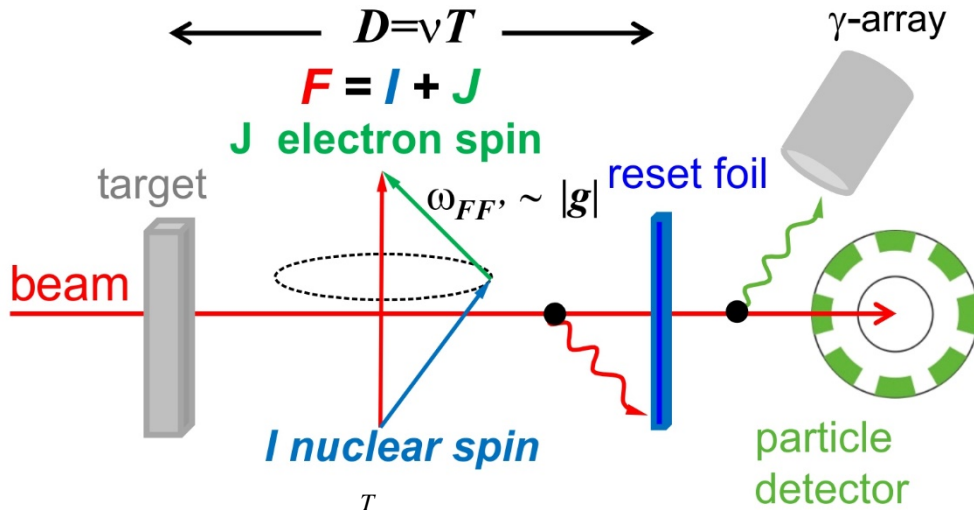

- observe **several rotations** of the nuclear spin ensemble within its lifetime  
 $\rightarrow$  for a state with  $g \sim 0.4 - 0.5$

lifetime                      magnetic field

150 ns                        1 Tesla

1.5 ps                        **100 kTesla**

# TDRIV – basic principles and RIB geometry

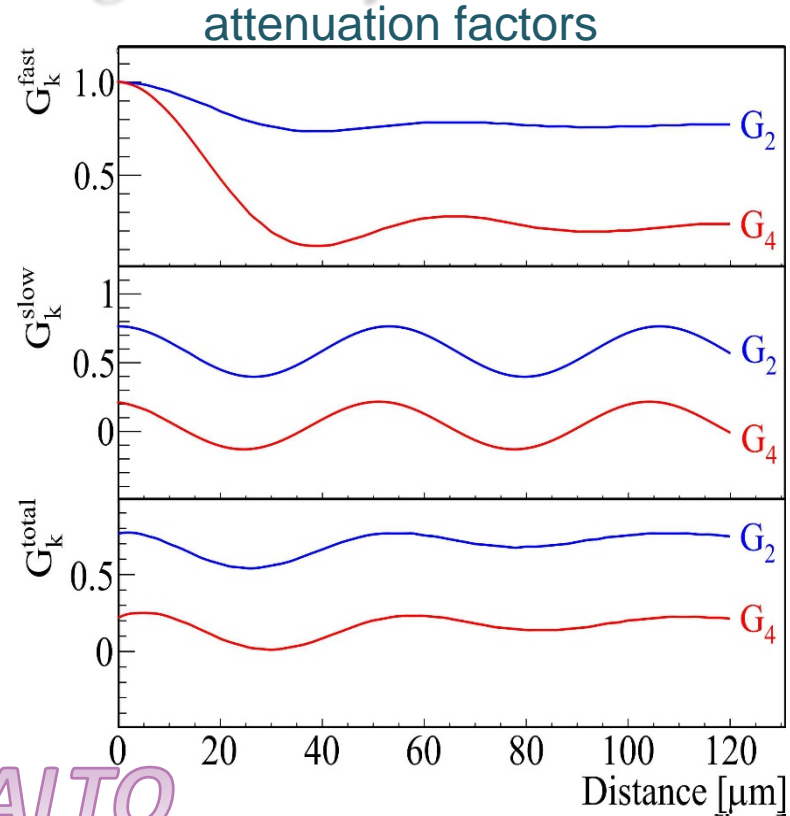

$$\overline{G_k(T)} = \int_0^T G_k(t) \lambda e^{-\lambda t} dt$$

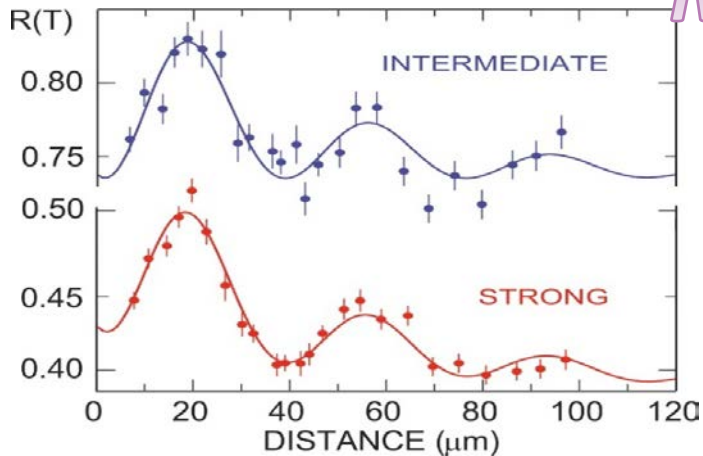

$$G_k(T) G_k(\infty)$$

$$G_k(\infty) = \int_0^\infty G_k(t) \lambda e^{-\lambda t} dt$$

A.E. Stuchbery et al., Phys. Rev. C71, 047302 (2005).

$^{24}\text{Mg}$  @ ALTO

$|g(2^+)| = 0.538 (13)$

A. Kusoglu et al., PRL 114, 062501 (2015)

# TDRIV @ HIE-ISOLDE – the setup

## DSSD for particle detection

- *3.9 mg/cm<sup>2</sup> Nb target*
- *1.1 mg/cm<sup>2</sup> Ta degrader*

- 8 Miniball triple cluster detectors @ (close to) 90° angles

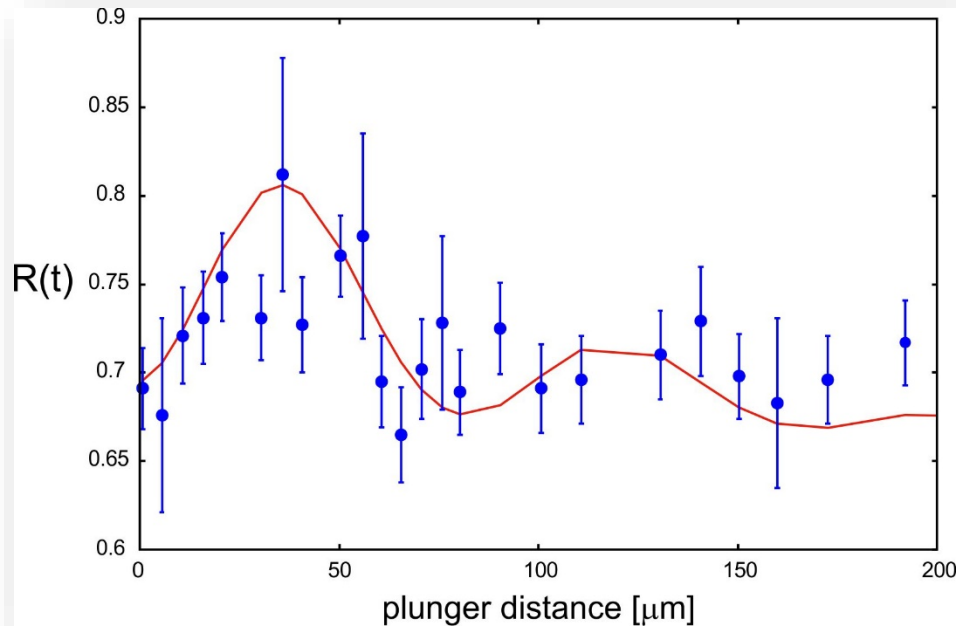

- angular coverage  
 $\theta = 21^\circ - 50^\circ$   
14 sectors  
 $\varphi = 0^\circ - 360^\circ$   
4 quadrants, 12 sectors each

- *first use of the Miniball plunger*
- ~ 20 distances

- ~7% efficiency at 1.4 MeV

# $^{22}\text{Ne}$ – a “test” measurement

- $^{22}\text{Ne}$  (5.5 Mev/u, 1.5 ppA) – from EBIS rest gas
- Beam intensity ( $10^7$  pps) - limited by the scattering rate in the CD detector
- 5 days stable beam run

our preliminary value:  
 $|g| = 0.445(25)$

previous measurements:

R.E. Horstman *et al.*, NP A 275 (1977), 237

$|g| = 0.326(12)$

and

R. Böhm *et al.*, Z. Phys. A 278 (1976) 133

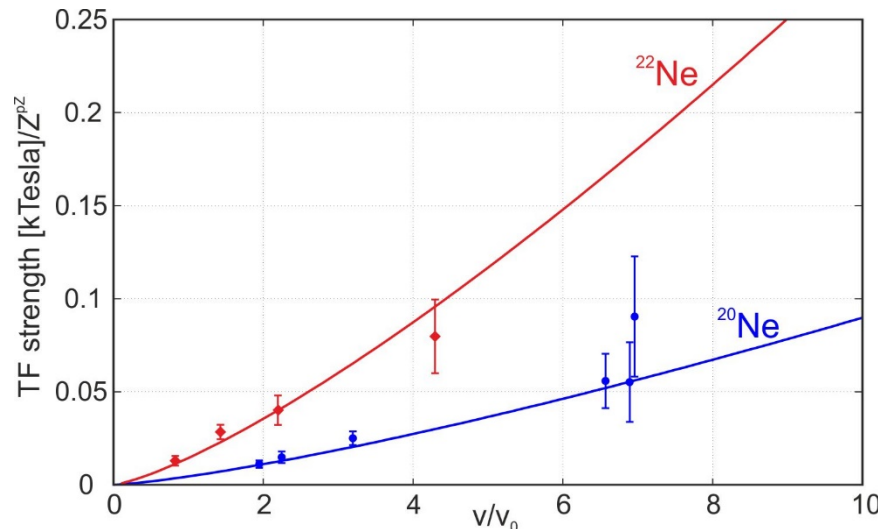

$|g| = 0.36(3)$

# How reliable is the previous value of $g(2^+)$ of $^{22}\text{Ne}$ ?

- Could there be something *not quite correct* with the **previous most accurate  $g(2^+)$  value** of R.E. Horstman *et al.* (adopted by N.J. Stone in “Table of nuclear moments” INDC(NDS)-0658)???
- Comparison of previously known  $g(2^+)$  in
  - $^{20}\text{Ne}$ :  $|g| = 0.54(4)$  (R.E. Horstman *et al.*, NP A 248, (1975), 291 )
  - and
  - $^{22}\text{Ne}$ :  $|g| = 0.326(12)$  (R.E. Horstman *et al.*, NP A 275 (1977), 237)

gives a discrepancy (a factor of  $\sim 2!$ ) for the **transient field strength** of the two isotopes of the same element – **unphysical!!!**

# The “real RIB” experiment

- $^{28}\text{Mg}$  ( $t_{1/2} = 20.9$  h) – the bright side
  - expected beam intensity:  $1 \times 10^6 - 5 \times 10^5$  pps
  - **available: +  $5 \times 10^6$  pps!!**
  - well pronounced particle –  $\gamma$  angular correlations observed
  - 10 plunger distances measured
- **and the difficulties ...**
  - **count rates in the Ge detectors - + 5k /Ge core** (and increasing!) with half of the available proton beam intensity. Running for 7 days @ 10k/det.
  - **scattered beam** deposited in the vacuum chamber
    - beta-decay  $^{28}\text{Mg} \rightarrow ^{28}\text{Al} \rightarrow ^{28}\text{Si}$  (stable): 100% 1779 keV + more then 60 % of higher then 1342 keV – impossible to be shielded ...
- Present status
  - data under analysis in progress

# Conclusions and outlook

- Magnetic moments of **single particle** (*odd-mass ground or isomeric states*) vs. **collective** (*short-lived excited states*) – probing different components and admixtures in the nuclear wave function
- Studies with high intensities **post-accelerated RIB** are very promising but require some special attention. The radioactive ion beam are ... **radioactive. RIB of  $10^6$  pps is high intensity!** Where is the compromise between **high-efficiency** vs. **large opening** for RIB's?
- Relying on **old, “well established” results** one may run into **surprises**. Revisiting experimental results from few decades ago (pushing the limits at their time) might be a necessary step before reaching for new exciting **radioactive beam challenges**.
- Stay tuned for exciting results to follow

# The collaboration

- CSNSM, Orsay, France – J. Ljungvall, A. Boukhari, R. Lozeva
- ANU, Canberra, Australia – A.E. Stuchbery, B. Coombes
- ISOLDE, Geneva, Switzerland – L.Gaffney
- ELI-NP, Magurele, Romania - D.L. Balabanski, A. Kusoglu, C. Sotty
- IPN, Orsay, France – D.T. Yordanov
- IKP, Uni. Cologne, Germany – N. Warr, Ch. Fransen, Th. Braunroth, A. Goldkuhle
- Uni. Complutense, Madrid, Spain – L.M. Fraile, J. Benito Garcia
- IKP, TU Darmstadt, Germany – T. Kroell, C.Henrich, O. Papst, V. Werner, J. Wiederhold
- Uni. Manchester, UK – N.S. Bondili, D. Cullen, M. Giles, L. Barber
- Uni. Athens, Greece – Th. Mertzimekis, A. Chalil, G. Zagoraios
