Study of excited states of ^{12}Be through $^{13}\text{B}(-p)$

Previous study :

J.Smith et al., Phys Rev, *Low-lying unbound states in ^{12}Be*

Performed at MSU NSCL

$E=1243\text{ keV}$
 $\Gamma= 640\text{ keV}$

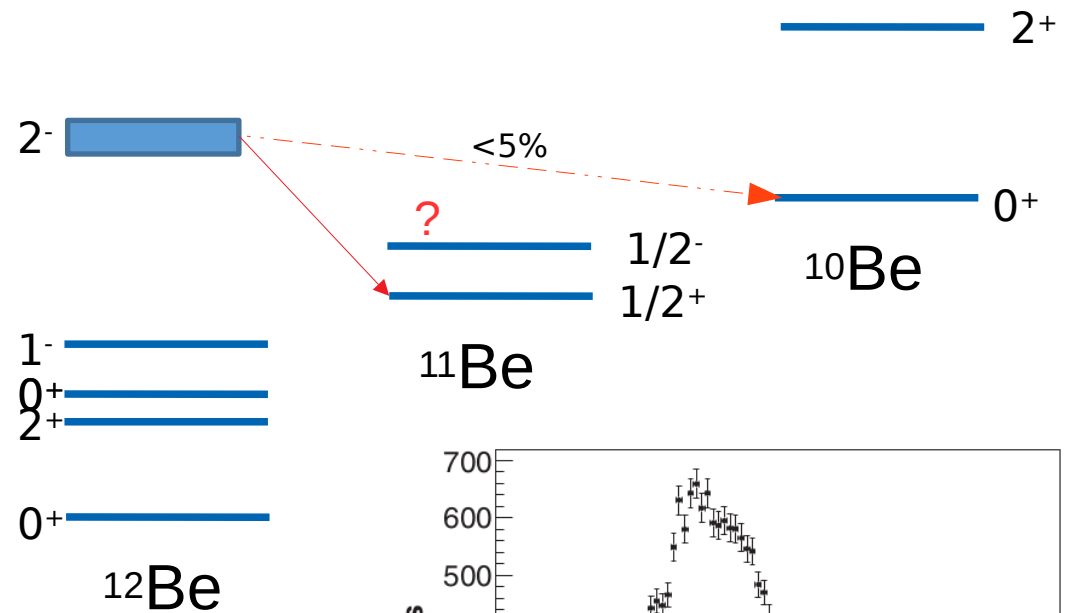

Study of excited states of ^{12}Be through $^{13}\text{B}(-p)$

Previous study :

J.Smith et al., Phys Rev, *Low-lying unbound states in ^{12}Be*

Performed at MSU NSCL

$E=1243\text{ keV}$
 $\Gamma= 640\text{ keV}$

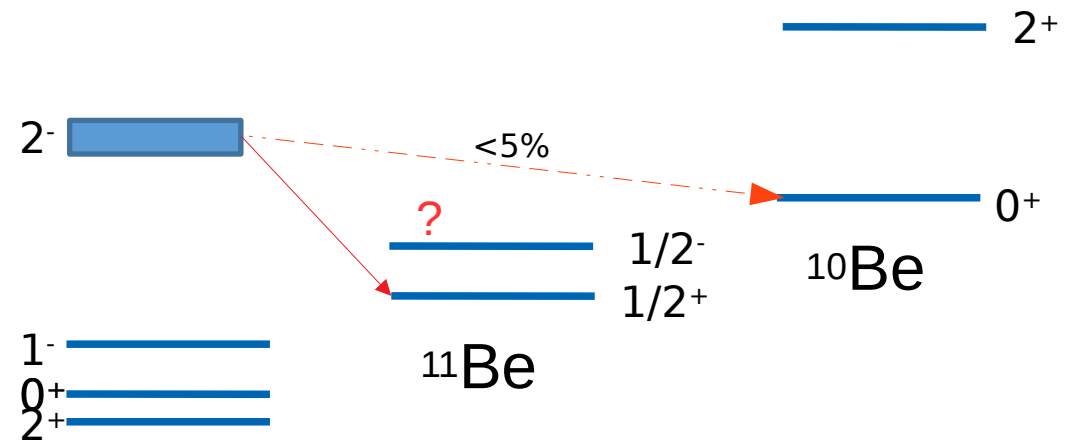

Study of excited states of ^{12}Be through $^{13}\text{B}(-p)$

Previous study :
J.Smith et al., Phys Rev, *Low-lying unbound states in ^{12}Be*
Performed at MSU NSCL

Nature of the $E_n = 1.24\text{ MeV}$ state in ^{12}Be

H.T. Fortune^a

Department of Physics and Astronomy, University of Pennsylvania, Philadelphia, Pennsylvania, 19104, USA

Disagreement between Smith and Fortune
 (state parity and **decay mode**)

Experimental setup

S393 experiment(2010)

GSI facility
Darmstadt, Germany
Court. GSI

Experimental setup

S393 experiment(2010)

- ✓ Primary beam : ^{40}Ar 490MeV/n
- ✓ Nuclei of interest : Bp , FRS degrader
- ✓ Secondary beam \rightarrow target ($\text{CH}_2 \sim 1\text{g/cm}^2$)

Study $^{13}\text{B}(p,2p)^{12}\text{Be}$ reaction

Some publications on the same set of data:

- Effective proton-neutron interaction near the drip line from unbound states in $^{25,26}\text{F}$, *M. Vandebrouck et al.*, PRC(2017)
- Strong Neutron pairing in core+4n nuclei, *A.Revel et al.*, PRL (2018)
(^{18}C & ^{20}O)

Experimental setup

S393 experiment(2010)

GSI facility
Darmstadt, Germany
Court. GSI

- ✓ Primary beam : ${}^{40}\text{Ar}$ 490MeV/n
- ✓ Nuclei of interest : Bp , FRS degrader
- ✓ Secondary beam \rightarrow target ($\text{CH}_2 \sim 1\text{g/cm}^2$)

Study ${}^{13}\text{B}(p,2p){}^{12}\text{Be}$ reaction

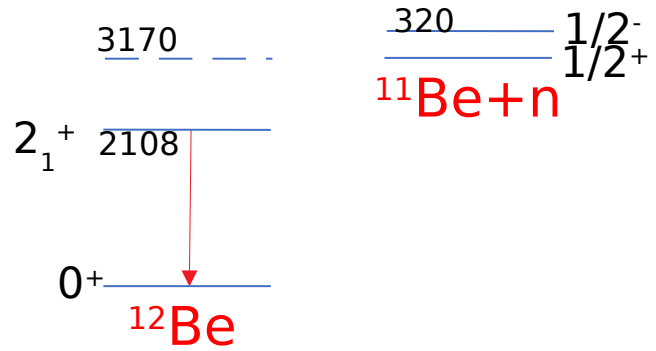

Experimental setup

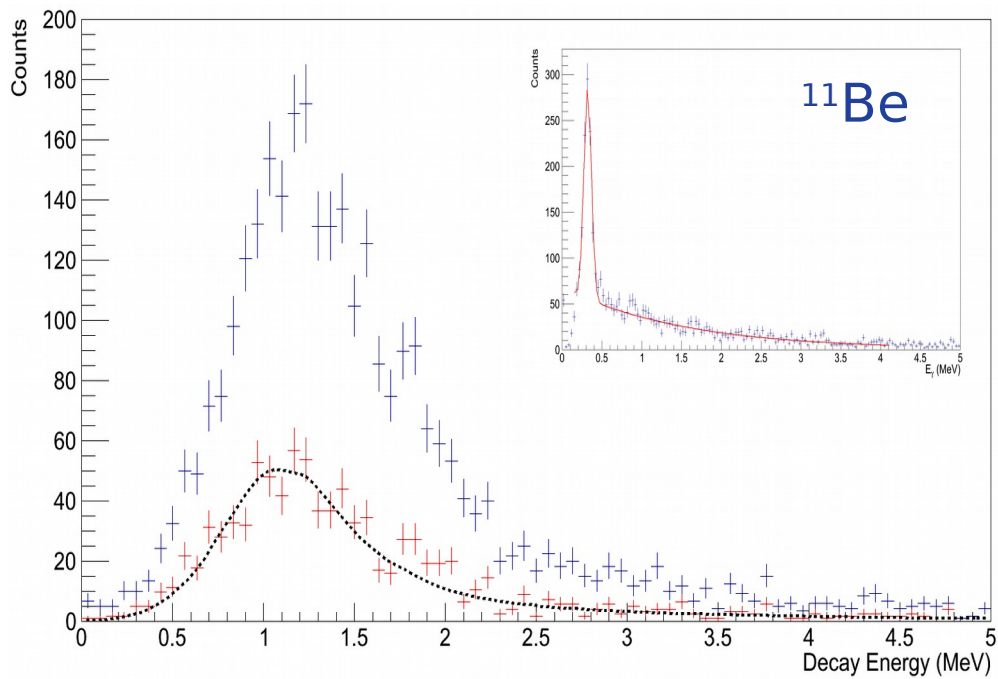

Better set up as compared to that of NSCL : gamma detection, better neutron efficiency → 2n detection

Results : bound and $^{11}\text{Be}^*+n$ states

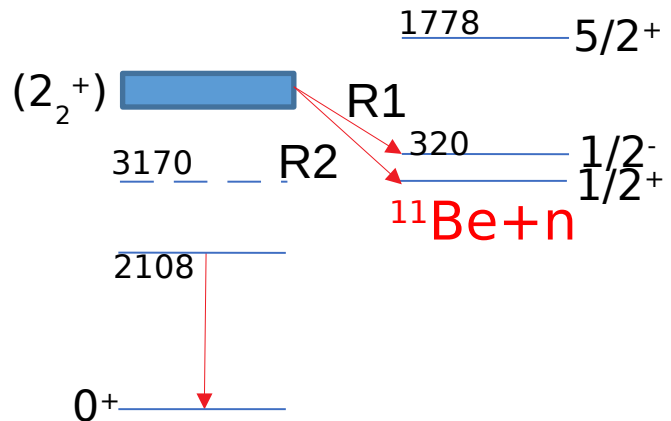

Results : bound and $^{11}\text{Be}^*+n$ states

-detection of gamma at 320 keV in ^{11}Be

Results : bound and $^{11}\text{Be}^*+n$ states

-detection of gamma at 320 keV in ^{11}Be

Fit : BW convolved by response function

$E \sim 1300$ keV
 $\Gamma \sim 400$ keV

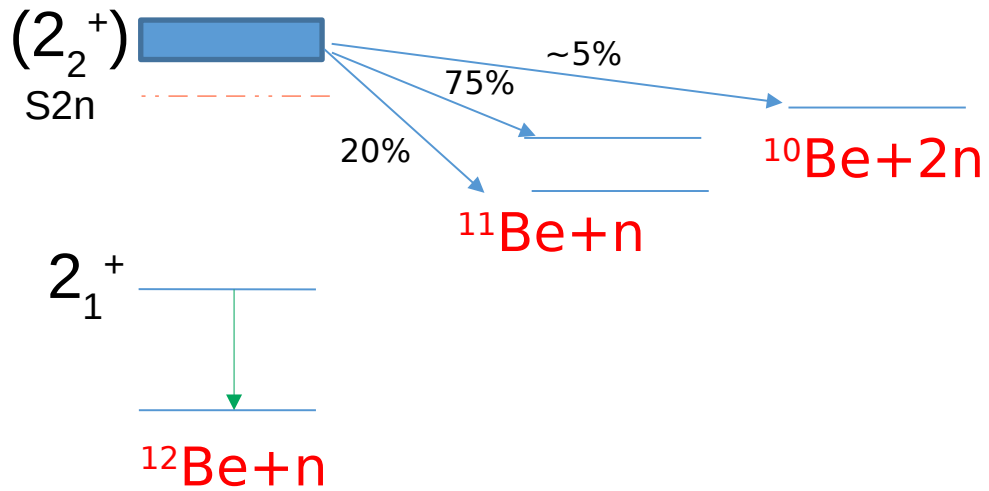

Results : $^{11}\text{Be}^* + 2n$ states

Good agreement with H.T Fortune :

- Halo state of ^{11}Be weakly populated
- Excited state is mostly populated

Results : $^{11}\text{Be}^* + 2n$ states

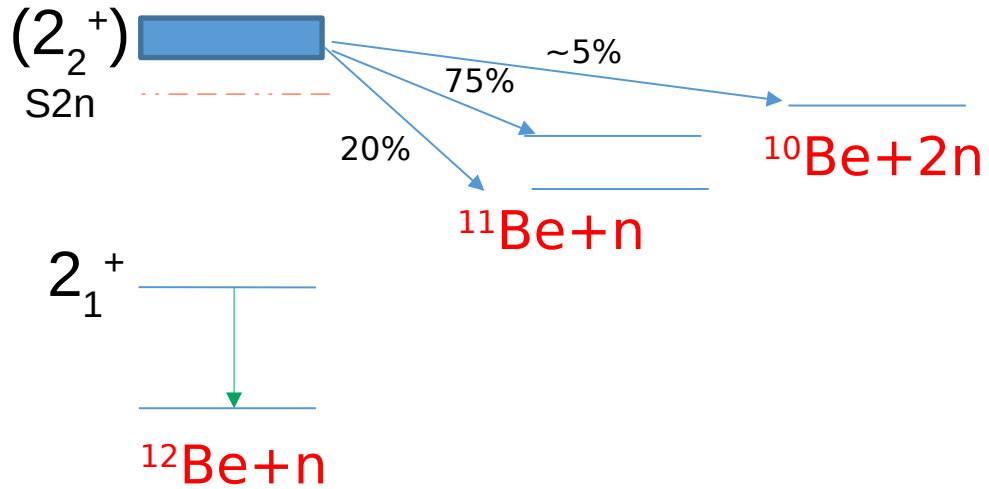

Good agreement with H.T Fortune :

- Halo state of ^{11}Be weakly populated
- Excited state is mostly populated

- The bound 2_1^+ (deformed) decays by gamma
- The unbound one (2_2^+) decays by $1n$ emission

Results : $^{11}\text{Be}^* + 2n$ states

Good agreement with H.T Fortune :

- Halo state of ^{11}Be weakly populated
- Excited state is mostly populated

- The bound 2_1^+ (deformed) decays by gamma
- The unbound one (2_2^+) decays by $1n$ emission

Which % of $2n$ emission ? Direct decay

Results : $^{11}\text{Be}^* + n$ states

Good agreement with H.T Fortune :

- Halo state of ^{11}Be weakly populated
- Excited state mostly populated

- The bound 2_1^+ (deformed) decays by gamma
- The unbound one (2_2^+) decays by $1n$ emission

Which % of $2n$ emission ? Direct decay

Study of 3 body decay

Decay spectrum

Results : $^{10}\text{Be}^* + n$ states

Results : $^{10}\text{Be}^* + n$ states

Decay energy for $^{10}\text{Be} + 2n$

Results : $^{10}\text{Be}^* + n$ states

- We detect a gamma at 3.4MeV in ^{10}Be
- Possible decay through $2^+ \rightarrow$ Shift of 3.4MeV in 2n Energy decay
- We split the 2n spectrum in 3 ranges of energy: 0-4, 4-8 and 8-12 MeV

Decay energy for $^{10}\text{Be}+2n$

Correlations and Dalitz plots

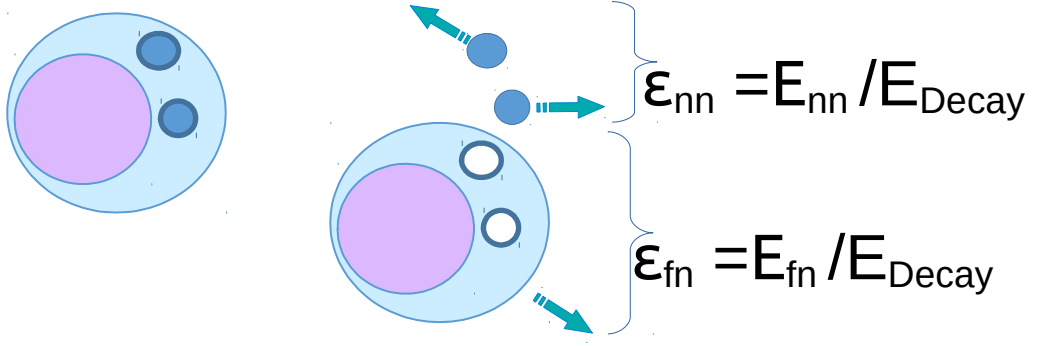

$$\epsilon_{nn} = E_{nn} / E_{\text{Decay}}$$

$$\epsilon_{fn} = E_{fn} / E_{\text{Decay}}$$

New Phenomenon

Contradictory inputs

- short living resonance
- narrow resonance

$$\tau = \hbar/\Gamma_r$$

New Phenomenon

Contradictory inputs

- short living resonance
- narrow resonance

Possible explanations

- Very compact structure : $r_{nn} < 2.6\text{fm}$

New Phenomenon

Contradictory inputs

- short living resonance
- narrow resonance

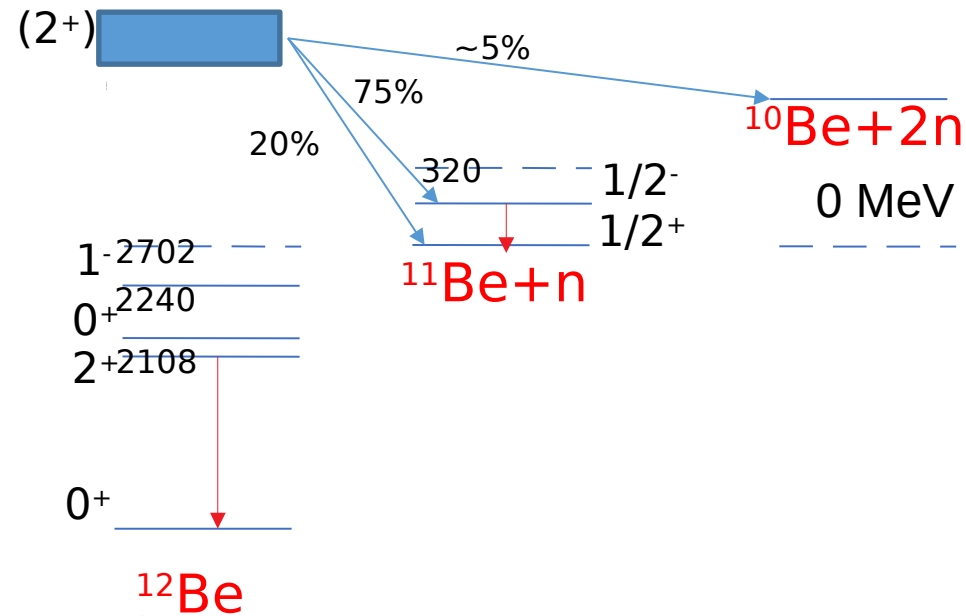

Possible explanations

- Very compact structure : $r_{nn} < 2.6\text{fm}$
- Strong momentum correlation : $W(r_{nn}) \rightarrow W(r_{nn}, q_{nn})$

Summary

- ^{13}B was produced by a primary beam of ^{40}Ar (490MeV/n) at GSI
- Using proton knock-out reaction bound and unbound states of ^{12}Be were populated
- A combined detection of Gamma, neutrons and core-fragments allowed us to study these states in detail

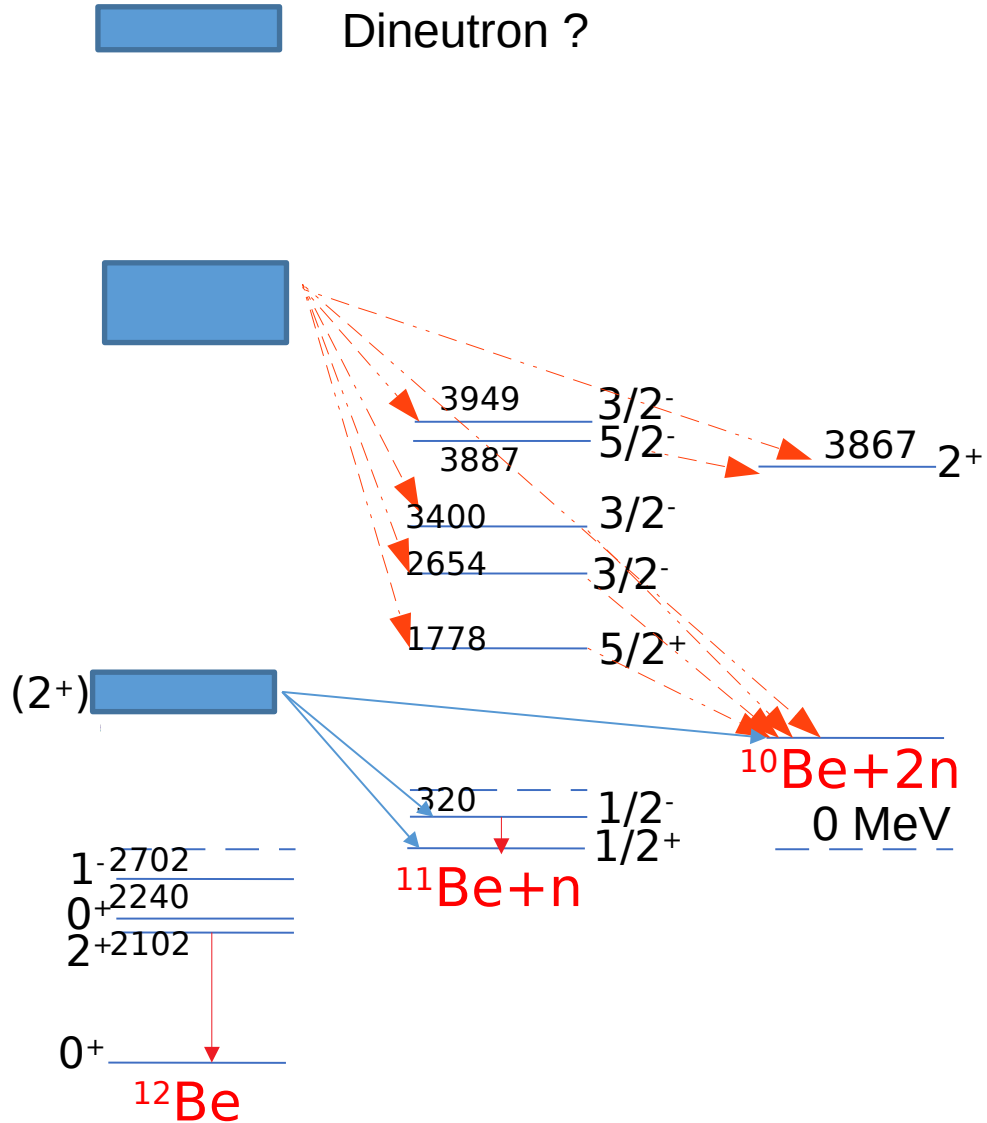

- a bound 2^+ state was observed by gamma detection at 2108 keV

- The second 2^+ state was strongly populated and its decay modes were studied:

The fact that this state decays mainly on the excited state of ^{11}Be (less deformed) and populated from spherical ^{13}B gives a hint on its sphericity

Summary

Higher excited states were studied using Dalitz plots

0-4MeV:
 Fit with 15% Sequential
 decay + 85% Direct decay

New phenomenon

Very compact structure :
 $r_{nn} < 2.6\text{fm}$

or

Strong momentum
 correlation :
 $W(r_{nn}) \rightarrow W(r_{nn}, q_{nn})$
